# **1 ABOUT THIS MANUAL**

This manual is set up to guide you through the step-by-step installation of your iMNP, so that you can follow it through from the front to the back. Make sure you familiarize yourself thoroughly with the safety and security precautions detailed in Chapter 2  $\Rightarrow$  before you begin to install your iMNP. TELES is not liable for any damage or injury resulting from a failure to follow these safety and security instructions!

### 1.1 ORGANIZATION

This manual is organized into the following chapters.

- Chapter 1, "About this Manual" introduces the iMNP Systems Manual and how it is set up.
- **Chapter 2, "Safety and Security Precautions"** describes the safety and security measures necessary for smooth operation of your TELES.iMNP.
- Chapter 3, "System Overview" briefly describes the iMNP and its implementation scenarios.
- **Chapter 4, "iMNP Installation"** contains information on basic installation and configuration of your iMNP.
- Chapter 5, "Routing and Configuration" describes the iMNP's individual configuration files and parameters.
- **Chapter 6**, "**iMNP User Interface**" contains a description of the iMNP's user interface.
- **Chapter 7, "Additional Routing Options"** contains a description of additional routing options to enable you to expand or fine tune the functionality of your iMNP.
- Chapter 8, "The iMNP Database" describes how to create and update the iMNP's database.

#### **1.2 CONVENTIONS**

This document uses the following typographic conventions:

- **Bold** items from the GUI menu.
- Halfbold items from the GUI and the menu.
- Code file names, variables and constants in configuration files or commands in body text.
- "conventions" on page 4  $\Rightarrow$  cross-references can be accessed in the PDF files by a single mouse click.

Configuration data or extracts are written in single-column tables with a gray background.

#### **1.3 SAFETY SYMBOLS**

The following symbols are used to indicate important information and to describe levels of possible danger.

Useful information with no safety implications.

# SAFETY SYMBOLS

	Attention Information that must be adhered to as it is necessary to ensure that the system func- tions correctly and to avoid material damage.
$\triangle$	Warning Danger. Could cause personal injury or damage to the system.
	Dangerous voltage Could cause injury by high voltage and/or damage the system.
	Electrostatic discharge Components at risk of discharge must be grounded before being touched.

# **2 SAFETY AND SECURITY PRECAUTIONS**

Please be sure and take time to read this section to ensure your personal safety and proper operation of your TELES infrastructure system.

To avoid personal injury or damage to the system, please follow all safety instructions before you begin working on your TELES infrastructure system.

TELES infrastructure systems are CE certified and fulfill all relevant security requirements. The manufacturer assumes no liability for consequential damages or for damages resulting from unauthorized changes.

This chapter applies for all TELES systems. Information that applies only for individual TELES systems specifies the system for which it applies.

#### 2.1 SAFETY MEASURES

Danger of electric shocks - the power supplies run on 230 V. Unplug the TELES infrastructure system from its power source before working on the power supply or extension socket.

Make sure to install the system near the power source and that the power source is easily accessible.

Do not open the TELES infrastructure system except to install an additional TELES component. Changes in the device are not permitted.

Wire your system using only the cables included in the package contents. Use only proper ISDN and Ethernet cables.

Be sure to respect country-specific regulations, standards or guidelines for accident prevention.

Bear in mind that telephone and WAN lines are also energized and can cause electric shocks.

Do not insert foreign objects into openings in the device. Conductible objects can cause short circuits that result in fire, electric shock or damage to the device.

#### 2.2 TIPS FOR EMC PROTECTION

- Use shielded cables.
- Do not remove any housing components. They provide EMC protection.

## 2.3 SYSTEM SECURITY

This section describes all points crucial to the TELES infrastructure system's system security.

The system's location must support normal operation of TELES infrastructure systems according to EN ETS 300 386. Be sure to select the location with the following conditions in mind:

- **Location:** Make sure you install the system in a clean, dry, dust-free location. If possible, the site should be air-conditioned. The site must be free of strong electrical or magnetic fields, which cause disrupted signals and, in extreme cases, system failure.
- **Temperature:** The site must maintain a temperature between 0 and 45°C. Be sure to guard against temperature fluctuations. Resulting condensation can cause short circuiting. The humidity level may not exceed 80%. To avoid overheating the system, make sure the site provides adequate ventilation.
- **Power:** The site must contain a central emergency switch for the entire power source. The site's fuses must be calculated to provide adequate system security. The electrical facilities must comply with applicable regulations. The operating voltage and frequency may not exceed or fall below what is stated on the label.
- Antenna: iGATE contains no provision or protective device against power surges or lightning strikes. The
  installation of the antenna must fulfill all necessary safety requirements. Employ the services of a
  professional antenna installer.

### 2.4 SYSTEM SECURITY

Regular servicing ensures that your TELES system runs trouble-free. Servicing also includes looking after the room in which the system is set up. Ensure that the air-conditioning and its filter system are regularly checked and that the premises are cleaned on a regular basis.

#### 2.4.1 REPLACING COMPONENTS

If your TELES system contains any of the following components, replace them according to the following table:

Component	Life Span
Filter pads	6 months
Power adapter	5 years
Fan	5 years

#### Table 2.1 Component life span

# 2.4.2 PROTECTING THE OPERATING SYSTEM

Changing configuration data may lead to malfunctions and/or misrouting, as well as possible consequential damage. Make changes at your own risk. TELES is not liable for any possible damage resulting from or in relation to such changes. Please thoroughly check any changes you or a third party have made to your configuration!

Make sure your hard disk or flash disk contains enough storage space. Downloading the log files and deleting them from the system on a regular basis will ensure your system's reliability.

Be careful when deleting files that you do not delete any files necessary for system operation.

Do not perform queries on the database. This can result in damages to the database. Do not use any MySQL tools, such as MySQL-Front to make changes in or perform tests on the database.

# 2.5 NETWORK SECURITY

Every day hackers develop new ways to break into systems through the Internet. While TELES takes great care to ensure the security of its systems, any system with access through the Internet is only as secure as its user makes it. Therefore, to avoid unwanted security breaches and resulting system malfunctions, you must take the following steps to secure your TELES system if you connect it to the Internet:

- Use an application gateway or a packet firewall.
- To limit access to the system to secure remote devices, delete the default route and add individual secure network segments.
- Access to the system via Telnet, FTP, HTTP, iGATE Manager or remote vGateDesktop must be password protected. Do not use obvious passwords (anything from sesame to your mother-in-laws maiden name). Remember: the password that is easiest to remember is also likely to be easiest to crack.

The firewall must support the following features:

- Protection against IP spoofing
- Logging of all attempts to access the system

The firewall must be able to check the following information and only allow trusted users to access the TELES system:

- IP source address
- IP destination address
- Protocol (whether the packet is TCP, UDP, or ICMP)
- TCP or UDP source port
- TCP or UDP destination port
- ICMP message type

For operation and remote administration of your TELES system, open only the following ports only when the indicated services are used.

Service	Protocol	Port			
For all systems except vGATE					
FTP	ТСР	21 (default, can be set)			
Telnet (for TELES debug access only)	ТСР	23			
SMTP	ТСР	25			
DNS forward	UDP	53			
HTTP	ТСР	80 (default, can be set)			
SNTP	UDP	123			
SNMP	UDP	161			
H.225 registration, admission, sta- tus	UDP	1719 (default, can be set)			
H.225 signaling	ТСР	1720 (default, can be set)			
Radius	UDP	1812 (default, can be set)			
Radius accounting	UDP	1813 (default, can be set)			
GATE Manager	ТСР	4445 (default, can be set)			
SIP signaling	UDP / TCP	5060 (default, can be set)			
RTP	UDP	29000-29120 (default, can be set)			
vGATE Control Unit	ТСР	57343			
vGATE tunneling	ТСР	4446			
For vGATE Control Unit and iMNP					
FTP	ТСР	21			
Telnet	ТСР	23			
MySQL database	ТСР	3306			
iGATE or TELES.VoIPBOX GSM/ CDMA 4FX to vGATE	ТСР	57342			
vGATE tunneling to iGATE or TELES.VoIPBOX GSM/CDMA 4FX	ТСР	4446			

Table 2.2	Default Ports	Used for	Specific	Services
			- p	

# SAFETY AND SECURITY PRECAUTIONS

Service	Protocol	Port
iGATE or TELES.VoIPBOX GSM/ CDMA 4FX to iMNP	ТСР	9003
Remote vGateDesktop	ТСР	57344
Remote vGateDesktop (read only)	ТСР	57345
iMNP	ТСР	9003
For vGATE SIM Unit		
vGATE Control Unit plus iGATE or TELES.VolPBOX GSM/CDMA 4FX	ТСР	51500
For NMS		
FTP	ТСР	21
Telnet	ТСР	23
MySQL database	ТСР	3306
NMS protocol	ТСР	5000
NMS update	ТСР	5001
NMS task	ТСР	5002
NMS task	ТСР	5003
NMS Listen	ТСР	4444
For vGATE Call Manager	·	·
Radius authentication	UDP	1812
Radius accounting	UDP	1813

#### Table 2.2 Default Ports Used for Specific Services (continued)

Connection from a vGATE Control Unit to an iGATE requires ICMP access. The TCP filters listed above are activated in the default configuration of the vGATE Control Unit or the NMS server.

# **3 SYSTEM OVERVIEW**

In most of the countries in the world, mobile carriers each have their own prefix. For end customers, this means that they would have to change their mobile phone number when they switch to another carrier. Since this would mean a significant reduction in competition, most countries require that carriers offer number portability. The result is that many mobile phone users have numbers with prefixes for carriers other than their own.

Ported Number LCR Extension is a function that enables you to map defined destination call numbers to other destination numbers or networks. This function is used to allow telecommunications subscribers to change carriers without having to change their telephone numbers.

Number portability is used in the fixed network, as well as in the mobile network. Usually the numbers are mapped in their respective networks. Implementation of this information and the corresponding routing processes result in significant cost savings, as tariff differences between calls to 'normal' and ported subscribers are eliminated.

The database of ported numbers runs on the iMNP, which provides the data online for the entire network.

The system automatically routes calls through specific ports or to defined numbers, so that all calls through the same carrier (including ported numbers) are routed through the port containing that carrier's SIM card as defined.

The iMNP can also access an external database to search for numbers it does not find in its own database. The iMNP automatically enters new numbers in its own database, so that the next call to the number will be routed accordingly without having to access the external database.

### 3.1 FEATURES

- Simple database generation and administration
- iMNP in proxy mode: communicate with an additional external database
- Numbers found in external database automatically entered in iMNP
- One database for all systems in the network
- Unlimited number of database entries
- No format restrictions for database entries
- Gateway whitelists
- Generation of statistics
- Automatically imports contents of text files to the database

### 3.1.1 SYSTEM REQUIREMENTS

Ported number screening requires the following:

- iGATE/VoIPGATE running second generation software 11.4 or higher, or first generation software 6.00f or higher and iLCR VoIP Board driver version 184 or higher
- An active license package for number portability
- A iMNP server
- A static IP address

# **4 imnp installation**

Implementation of individual scenarios requires adjustments to the appropriate interfaces.

Use a UPS to avoid possible damage resulting from power interruptions.

# 4.1 NETWORK AND FIREWALL REQUIREMENTS

Before installing your iMNP, make sure you can fulfill the following network and firewall requirements:

- Message round-trip time must be less than 500 ms. You can use PING to measure the round-trip time.
- The iMNP may be behind a PAT (Port Address Translation) firewall, as port 9003 may not be changed.
- Connection setup must be possible from iGATEs/VoIPGATEs to the iMNP at all times.

### 4.2 IMNP HARDWARE INSTALLATION

The iMNP runs on a 1HU, 19" PC. iMNP is a background server process with an attached MySQL V. 4.0.22 database that communicates with VoIPGATEs, iGATEs and with an optional external server.

Figure 4.1 provides a rear view of the iMNP. Connect the iMNP to the Ethernet LAN1 Interface.

Figure 4.1 iMNP - Rear view

# **5 ROUTING AND CONFIGURATION**

# 5.1 CONFIGURATION OF THE iGATE AND/OR VoIPGATE

Before you get started, you must enter the following settings in the connected iGATEs and/or VoIPGATEs.

#### 5.1.1 SECOND GENERATION CONFIGURATION

The following configuration applies only for iGATE and VoIPGATE systems running second generation software version 11.4 or higher. For a description of the configuration of first generation systems, see Chapter 5.1.2 on page 15  $\Rightarrow$ .

The **NumberPortability** section of the pabx.cfg file includes the parameters necessary for communication with the iMNP.

Parameter	Description
MNPQAddress= <ip addr=""></ip>	Enter the iMNP server's IP address.
MNPQPort= <port></port>	Enter port 9003.
MNPQAddress2= <ip addr=""></ip>	Enter the IP address to which the second number portability query is to be sent when "!" appears in the mapping entry. A second iMNP will then be queried, for example if the first on is not online.
MNPQPort2= <port></port>	Enter port to which the second number portability query is to be sent.
MNPQSum= <mode></mode>	This parameter must be activated (Yes) if a iMNP is used.

#### **Table 5.1** Overview of the NumberPortability parameters

**Example 5.1** NumberPortability parameters in the pabx.cfg

[NumberPortability] MNPQAddress=172.16.0.100 MNPQPort=9003 MNPQSum=Yes

### 5.1.2 FIRST GENERATION CONFIGURATION IN THE TIB.CFG

The following configuration applies only for iGATE and VoIPGATE systems running first generation software 6.00f and iLCR VoIP Board driver Version 184. For a description of the configuration of second generation systems (cf. Chapter 5.1.1 on page 14  $\Rightarrow$ ).

The System section of the tib.cfg file includes the parameters necessary for communication with the iMNP..

Parameter	Description
MNPQ: <mode></mode>	Enter Yes to activate the iMNP.
MNPQAddress: <ip addr=""></ip>	Enter the iMNP server's IP address.
MNPQPort: <port></port>	Enter port 9003.
MNPQSum: <mode></mode>	This parameter must be activated (Yes) if a iMNP is used.

#### Table 5.2 Overview of the System parameters

#### **Example 5.2** System parameters in the tib.cfg

[System] MNPQ:Yes MNPQAddress:172.16.0.100 MNPQPort:9003 MNPQSum:Yes

### 5.1.3 CONFIGURATION IN THE ROUTE.CFG

The configuration described here is for all compatible iGATE and VoIPGATE systems.

The following routing entry in the route.cfg file is required to activate an iMNP query:

#### MapAll<num>=|D@<num><<01</pre>

If you use digit collection, it must appear before the database request in the routing configuration (for a description of digit collection, see the chapter "Digit Collection" in the iGATE/VoIPGATE Systems Manual). A \$ placeholder mapping results in a subsequent iMNP query:

MapAll<num>=|\$ph<<<count>

MapAllph=|D@<num><<01

The routing entries for the iMNP results contain the keyword QN, followed by the query result, an equal sign and the controller:

#### MapAllQN<query>=<controller>

The following example uses digit collection (11 digits plus **\$ph**). Every incoming call with a leading digit of 0 results in an iMNP query. The SIM-card LAINs are used instead of controller numbers. All numbers that come back from the iMNP with the LAIN for Carrier\_1 (26211) are then routed through Carrier\_1's SIM card with CLIR. The same applies for Carrier\_2 (26212), Carrier\_3 (26213) and Carrier\_4 (26214). Numbers that the iMNP sends back as non-existing in the iMNP database (00000) are rejected. Numbers that are not found in the external database or numbers that could not be found because of a failed connection to the external server (99999) are routed as they come in (normal). If the iMNP does not respond within two seconds (D@0), the call is routed as it comes in, whether it is ported or not:

DTMFWaitDial=5 MapAll0=|\$ph<<14 MapAllph=|D@0<<01 MapAllQN26211=#26211 MapAllQN26212=#26212 MapAllQN26213=#26213 MapAllQN26214=#26214 MapAllQN00000=&81 MapAllQN99999=\$normal MapAllD@0=\$normal1 ; not in Database ;Carrier\_1 MapAllnormal0151=#262110151 MapAllnormal0160=#262110160 MapAllnormal0170=#262110170 MapAllnormal0171=#262110171 MapAllnormal0175=#262110175 ;Carrier\_2 MapAllnormal0152=#262120152 MapAllnormal0162=#262120162 MapAllnormal0172=#262120172 MapAllnormal0173=#262120173 MapAllnormal0174=#262120174 ;Carrier 3 MapAllnormal0155=#262130155 MapAllnormal0163=#262130163 MapAllnormal0177=#262130177 MapAllnormal0178=#262130178 :Carrier 4 MapAllnormal0159=#262140159 MapAllnormal0176=#262140176 MapAllnormal0179=#262140179

#### 5.2 SETTING UP AND MAINTAINING THE IMNP DATABASE

iMNP entries are maintained in text files. Each entry appears on a separate line containing the dialed number, a comma followed by the new five-digit ported carrier prefix (referred to in this document as LAIN) and destination numbers. You can either repeat the number after the LAIN or simply enter a +. The iMNP will interpret both entries in the same way. iMNP entries can appear in any order and be of any length:

<num>,<LAIN><num> or: <num>,<LAIN>+ The iMNP is divided into two tables. One contains individual direct numbers that are to be ported to a defined LAIN. The other table contains partial numbers; all numbers beginning with the digits entered here will be ported to the defined LAIN. These two tables are maintained in separate files.

In the following example of direct portability, only the carrier is ported. No call-number conversion occurs:

Example 5.4	iMNP	entries	for	direct	portability
-------------	------	---------	-----	--------	-------------

11721234567,26211+ 11712345671,26212+ 11775671234,26212+ 11546712345,26217+ 11743456712,26213+ 11734567123,26217+ ...

In the following example of partial portability, all calls beginning with the defined digits are ported as configured:

**Example 5.5** iMNP entries for partial portability

11721234,26211+ 1171234567,26212+ 117756,26212+ 1154671,26217+ ...

You can import and export the tables to and from the text files from the File menu. You can import partial tables that contain only individual new or changed entries. In this case it is not necessary to export the tables first.

By selecting **Settings** from the **Options** menu, you can also set the iMNP to import the files automatically (cf. Table 6.1 on page 19  $\Rightarrow$  ).

# **6 IMNP USER INTERFACE**

The iMNP application is used to record and display a log of activity and for administration of the server.

The file iNumPortCtrl.exe is located in the folder D:\NumberPortability. The Windows desktop contains a link to this file. Double-click this link to start the iMNP.

0171 ↓ 0199 If you close the interface, you can then open the iMNP user interface by double- or right-clicking the icon

the right side of the taskbar.

The log contains up to 2500 lines describing all activity on the iMNP. After the log has reached 2500 lines, the oldest entries are deleted. All entries are written into the log file, which is generated every day at midnight.

The file is then saved here: D:\NumberPortability\logfiles.

The menu bar contains the following:

# 7 ADDITIONAL ROUTING OPTIONS

#### 7.1 BACKUP iMNP

Enter the following additional parameter in the pabx.cfg to query a backup iMNP if the first iMNP does not respond:

MNPQAddress2=<ip addr>
MNPQPort2=<port>

[NumberPortability] MNPQAddress=172.16.0.100 MNPQPort=9003 MNPQAddress2=172.16.0.101 MNPQPort2=9003 MNPQSum=Yes

An exclamation point (!) in the ROUTE.CFG is the keyword for sending the request to the second iMNP:

#### MapAllD@<num>=|D@!<num><<01

The following example uses digit collection (11 digits plus **\$ph**). Every incoming call with a leading digit of 0 results in a database query to the iMNP with the IP address 172.16.0.100. The SIM-card LAINs are used instead of controller numbers. All numbers that come back from the iMNP with the LAIN for Carrier\_1 (26211) are then routed through Carrier\_1's SIM card with CLIR. The same applies for Carrier\_2 (26212), Carrier\_3 (26213) and Carrier\_4 (26214). Numbers that the iMNP sends back as non-existing in the iMNP database (00000) are rejected. Numbers that are not found in the external database or numbers that could not be found because of a failed connection to the external server (99999) are routed as they come in (normal). If the iMNP does not respond within two seconds (D@!0), a backup iMNP will be queried. The routing entries for the second iMNP also contain an exclamation point "!" and follow the same syntax as those for the first iMNP.

**Example 7.2** Sample configuration for iMNP backup

```
MapAll0=|$ph<<14
MapAllph=|D@0<<01
MapAllQN26211=#26211
MapAllQN26212=#26212
MapAllQN26213=#26213
MapAllQN26217=#26214
MapAllQN00000=&81
MapAllQN99999=$normal
MapAllD@0=|D@!0<<01
MapAllQ!N26211=#26211
MapAllQ!N26212=#26212
MapAllQ!N26213=#26213
MapAllQ!N26217=#26214
MapAllQ!N00000=&81
MapAllQ!N99999=$normal
MapAllD@!0=$normal
```

```
;Carrier_1
MapAllnormal0151=#262110151
MapAllnormal0160=#262110160
...
```

#### 7.2 DIFFERENT QUERY DESTINATIONS FOR DIFFERENT CALL NUMBERS

Enter the following additional parameter in the pabx.cfg to query one iMNP for some prefixes and another iMNP for others:

MNPQAddress2=<ip addr>

MNPQPort2=<port>

Example 7.3 Parameter for different query destinations for different call numbers

```
[NumberPortability]
MNPQAddress=172.16.0.100
MNPQPort=9003
MNPQAddress2=172.16.0.101
MNPQPort2=9003
MNPQSum=Yes
```

You can also use the exclamation point "!" in the route.cfg to send some numbers to one iMNP and others to a second iMNP.

In the following example, all numbers beginning with 00 (international) are sent to the first iMNP (172.16.0.100). Numbers beginning with 0 (national) are sent to the second iMNP (172.16.0.101). Calls with numbers that come back from the first iMNP with 11111 are routed through controller 40 to the VoIP carrier Carrier\_1. Calls with numbers that come back from the first iMNP with 22222 are routed to the VoIP carrier Carrier\_2. All international numbers that are not found are routed unchanged through the PSTN controller (9). National calls that are sent to the second iMNP are terminated through the PSTN using the carrier prefix 12345 if 12345 comes back from the iMNP. If 54321 comes back, the carrier with the prefix 54321 is used. If 99999 comes back, national calls are terminated unchanged through the PSTN.

MapAll2=92 MapAll3=93 MapAll4=94 MapAll5=95 MapAll6=96 MapAll7=97 MapAll8=98 MapAll9=99 MapAllph=|D@00<<01 MapAllsh=|D@!0<<01 MapAllQN11111=40Carrier 1: MapAllQN22222=40Carrier\_2: MapAllQN00000=&81 MapAllQN99999=\$normal MapAllD@0=900 MapAllQ!N12345=912345 MapAllQ!N54321=954321 MapAllQ!N00000=&81

MapAll00=|\$ph<<14 MapAll0=|\$sh<<14 MapAll1=91

MapAllD@!0=90 MapAllnormal=9

MapAllQ!N99999=\$normal

# 8 THE IMNP DATABASE

# 8.1 UPDATING THE IMNP DATABASE

To update the database NumPortDB, you must first close the program iNumPortCtrl.exe.

The following instructions update Version 1.0 to 14.0. If you are updating to or from another version, enter the relevant version numbers in the appropriate places.

iMNP Version 14.0 is compatible only with MySQL Version 4.0.X.

- Stop the WinMysqlAdmin Service by right-clicking the **s** icon in the right-hand corner of the taskbar and selecting WinNT | Stop the Service from the context menu. The traffic light will then turn red.
- Restart the WinMysqlAdmin Service by selecting **WinNT | Start the Service** from the same context menu, so that the traffic light turns green.
- Start the MSDOS command prompt at Start | Programs | Accessories | Command Prompt
- Enter D: and press Return
- Enter cd mysql\bin and press Return
- Enter mysql u simdbuser p and press Return
- Enter password:simdb and press Return
- Enter the command \. (backslash period space) and enter the path to the script (in this example, on the E: drive):
- E:\NumPort-Files\V14.0\NumPort\_DIFF\_V10\_V140.sql
- Press Return
- Enter exit to exit mysql
- Stop the WinMysqlAdmin Service by right-clicking the *icon* in the right-hand corner of the taskbar and selecting **WinNT | Stop the Service** from the context menu. The traffic light will then turn red.
- Restart the WinMysqlAdmin Service by selecting WinNT | Start the Service from the same context menu, so that the traffic light turns green.
- Remove the old file iNumPortCtrl.exe from the installation folder D:\NumberPortability, as well as the shortcut from the Windows Desktop. You can also delete the folder D:\NumberPortability if you like.
- Run the file **Setup**.exe from the folder that contains the new Version (E:\NumPortFiles\V14.0).
- In the Setup Wizard, click Browse and select the installation folder D: \NumberPortability. Select
  installation for Everyone. Continue by clicking Next until you have the option to Close the Setup Wizard.
  A shortcut to iNumPortCtrl.exe will automatically appear on the Windows Desktop.
- You can now start iNumPortCtrl.exe.

### 8.2 CREATING A BACKUP OF THE IMNP DATABASE

To secure your database, we strongly recommend that you create a backup.

To create a backup of the database, create a directory E:\BackupDB and copy the database F:\mysql\data\NumPortDB into the new directory.

To distinguish between different database versions, rename the database to include the version number in the name. To find the version number, select About iMNP from the Help menu of the iMNP.

#### Example:

You want to create a backup for Version 1.0. The path for the backup database will be:

#### E:\BackupDB\NumPortDB10

TELES AG Communication Systems Division Ernst-Reuter-Platz 8 10587 Berlin, Germany Phone: +49 30 399 28-00 Fax: +49 30 399 28-01 E-mail: sales@teles.com
